Problema 2.

Internally, the elements in a set are always sorted from lower to higher following a specific strict weak ordering criterion set on container construction.

Sets are typically implemented as binary search trees.

In their implementation in the C++ Standard Template Library, set containers take three template parameters:

```
template < class Key, class Compare = less<Key>,  
          class Allocator = allocator<Key> > class set;
```
